ABOUT

Data enthusiast with an accounting background, comfortable with numbers, reconciliation, and accurate reporting. Now studying Information Systems and building data skills: Python, SQL, Excel, and dashboard storytelling to turn analysis into useful business decisions.

TOOLS & SKILLS

Python · pandas | SQL | Excel · VBA | Streamlit | **Power BI dashboard design** | Jupyter Notebook | Data cleaning | EDA | Data visualization | Financial reporting

FEATURED PROJECTS

Bike Sharing Demand Analysis

Python · pandas · Streamlit | page 2

17,379 hourly records; explored demand peaks and weather patterns.

E-Commerce Sales & Customer Satisfaction

Python · pandas | page 3

Joined seven tables and connected delivery delays with lower reviews.

Power BI E-Commerce Dashboard Design

Power BI dashboard prototype | page 4

Executive KPIs, category revenue, and delivery-satisfaction views.

Inventory Information System for Sales & Purchases

Excel · VBA · Pandan Arum Plant Shop

Recorded sales, purchases, and stock movements for a small business.

Bike Sharing Demand Analysis

When are bikes most in demand, and how much does weather affect rentals? 2011–2012 data analysis to plan fleet readiness.

Dataset: UCI Bike Sharing, Washington D.C.
731 daily · 17,379 hourly records

1 BACKGROUND

An operator needs to know when demand spikes (to have bikes ready) and when it drops (to schedule maintenance).

2 BUSINESS QUESTIONS

- What are the peak rental hours on **working days** vs **weekends/holidays**?
- Which **weather condition** produces the highest average daily demand?

3 PROCESS

- **Wrangling:** datetime conversion; checked missing values, duplicates, code validity
- **Cleaning:** excluded 76 days with <24 hourly records from the hourly comparison to avoid bias
- **EDA** + temperature **binning** (4 groups)
- Interactive **dashboard** with Year, Season, Weather filters

TOTAL RENTALS
3.29 M
2011–2012

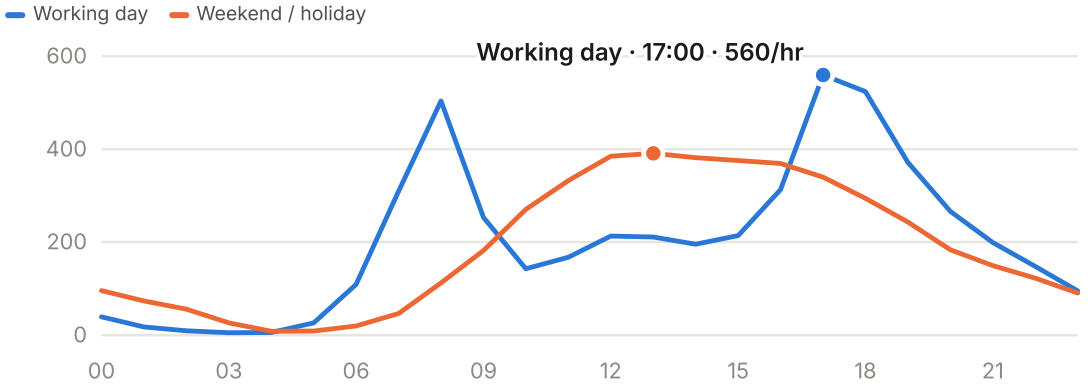

YOY GROWTH
+64.9%
1.24 M → 2.05 M

AVG PER DAY
4,504
rentals / day

REGISTERED USERS
81%
of total rentals

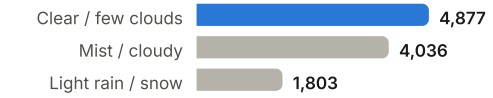

Average rentals per hour: working day vs weekend/holiday

Working days peak at 08:00 & 17:00 (commuting); weekends peak at 13:00 (~391/hr)

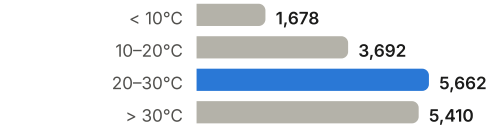

Average daily rentals by weather

Rain/snow cuts demand by ~63% vs clear weather

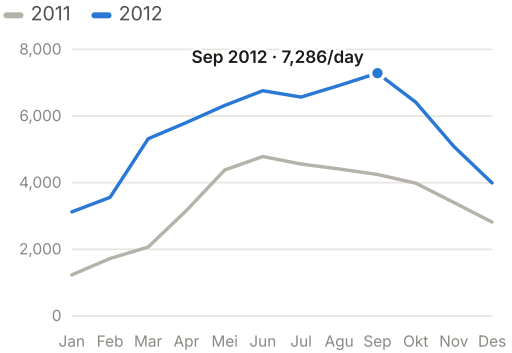

By temperature

Highest at 20–30°C

Monthly trend: average daily rentals

2012 is above 2011 every month; peak in September 2012

KEY INSIGHTS

1. On **working days** demand peaks at **17:00 (~560/hour)** and 08:00 (~504/hour), a commuter pattern.
2. On **weekends/holidays** demand is spread across **11:00–16:00**, peaking at 13:00 (~391/hour), a leisure pattern.
3. **Clear** weather averages 4,877 rentals/day vs only 1,803 during **light rain/snow**.
4. Total rentals grew **64.9%** in 2012, with the same seasonal pattern: low in Dec–Feb, high from May to October.

RECOMMENDATIONS

A. Add fleet capacity at stations at **07:00–09:00 and 16:00–19:00** on working days.

B. Schedule **maintenance & redistribution** during low-demand windows (00:00–05:00) and on bad-weather days.

C. Run casual-rider promotions on **sunny weekends** to convert them into registered members.

NOTE

The weather & temperature relationship is an **association**, not proven causation. High-demand data points are kept because they reflect real demand.

PROJECT 02 · PYTHON · PANDAS · E-COMMERCE

E-Commerce Sales & Customer Satisfaction

Which categories drive revenue, and how much does late delivery hurt customer reviews? Olist marketplace, Brazil.

Dataset: Olist Brazilian E-Commerce (public)
96,203 delivered orders · Jan 2017 – Aug 2018

1 BACKGROUND

Olist connects small sellers to Brazil's largest marketplaces. Growth depends on selling the right categories and keeping customers happy enough to leave good reviews.

2 BUSINESS QUESTIONS

- Which **categories** generate the most revenue, and how do orders **trend** monthly?
- Does **late delivery** lower **review scores**, and by how much?

3 PROCESS

- **Joined 7 tables** (orders, items, products, reviews, customers, payments, category names)
- **Cleaning:** delivered orders only; full months only; latest review per order; categories translated to English
- **Feature:** late flag & days late vs estimated date, grouped into 5 delay bins

PRODUCT REVENUE
R$13.2M
excl. shipping

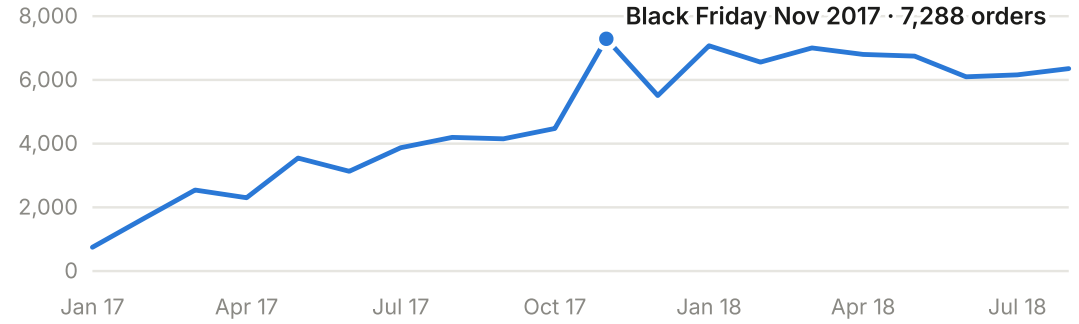

AVG ORDER VALUE
R$137
per order

AVG REVIEW
4.16 ★
out of 5

LATE DELIVERIES
6.8%
of delivered orders

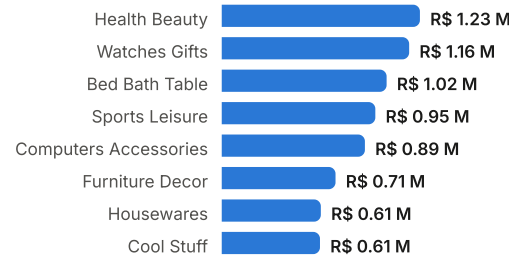

Delivered orders per month

Jan–Aug 2018 orders were 140% higher than the same months in 2017; the Black Friday spike is the highest month

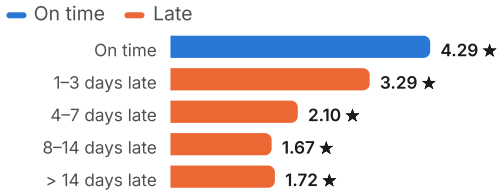

Top 8 categories by revenue

Top 10 of 71 categories = 62% of revenue

Average review score by delivery delay

Even 1–3 days late drops the score by a full star

KEY INSIGHTS

1. **Late orders average 2.27★** vs 4.29★ on time. 62% of late orders get a 1–2★ review vs only 9% on time.
2. Only **6.8%** of orders are late, yet they account for **~33% of all 1–2★ reviews**.
3. **Health & beauty** and **watches & gifts** lead revenue; the top 10 categories make up 62%.
4. Orders peaked in **Nov 2017 (Black Friday)** at 7,288 and stayed above 6,000/month through 2018.

RECOMMENDATIONS

- A Set **more realistic delivery estimates** and alert customers early when an order will be late.
- B Monitor sellers with frequent late shipments; prioritize logistics for the top 10 categories.
- C Prepare stock & logistics capacity ahead of **Black Friday**.

NOTE

Delay vs review is an **association**. Revenue = product price, excluding shipping (BRL).

PROJECT 03 · POWER BI DASHBOARD DESIGN · OLIST

E-Commerce Sales & Customer Experience

Can sales performance and delivery reliability explain customer satisfaction?

PUBLIC DATASET · OLIST

Brazilian e-commerce · 2017–2018

Kaggle · anonymized commercial data

DELIVERED ORDERS	PRODUCT REVENUE	AVG ORDER VALUE	AVG REVIEW	LATE DELIVERIES
96,203	**R$13.2M**	**R$137**	**4.16 / 5**	**6.8%**
Delivered orders in scope	Excluding shipping	Per delivered order	Customer review score	Of delivered orders

PRODUCT CATEGORY REVENUE

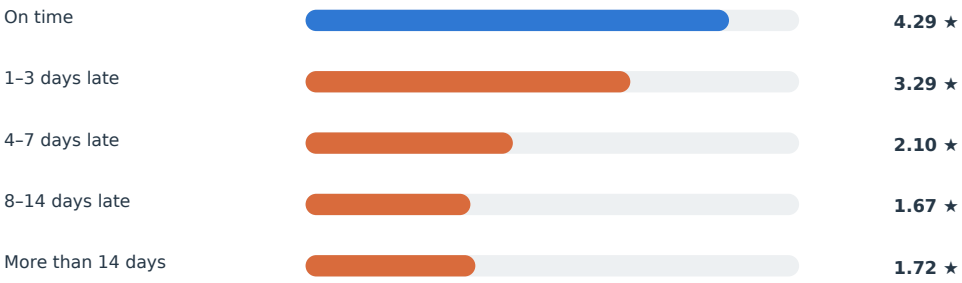

Top categories by product revenue · BRL

Top 10 of 71 categories represent 62% of product revenue.

CUSTOMER REVIEW BY DELIVERY DELAY

Average review score · 1 to 5 stars

Delivery delay is associated with lower reviews; this is not proof of causation.

KEY FINDINGS

01 Late orders average 2.27★ versus 4.29★ for on-time orders; late orders account for about one-third of all 1–2★ reviews.

02 The top 10 of 71 categories contribute 62% of product revenue.

03 Monthly orders peaked at 7,288 in November 2017.

BUSINESS RECOMMENDATIONS

A. Set realistic delivery estimates and notify customers early when delays are likely.

B. Monitor late-shipping sellers and prioritize logistics for the highest-revenue categories.

C. Plan stock and fulfillment capacity ahead of seasonal demand peaks.

POWER BI BUILD PLAN

Model: Orders, Order Items, Reviews, Products, and Category Translation; relate tables by order, product, and category keys.

Core measures: Delivered Orders, Product Revenue, Average Order Value, Average Review, Late Orders, and Late Delivery Rate.

Interactions: Date, category, and delivery-status slicers.
